

What I liked the most is that the webpage gives an alternative on how to convert more than one negative number into a binary code.

I don't like the description of what the calculator/converter does, instead I'd put a clear description of the keywords (i.e., Binary, Decimal, Hexadecimal) and how the converter works with each.

This might help those with minimal knowledge of the context.

I think the search button is not needed since the nav-bar has everything the webpage offers.

Also, there's only one two-sided arrow, I will not include, it might mislead the user into thinking the converter only works between binary and decimal.

An aside calculator will be included.
